

Community Wastewater Management System

Mallala CWMS – Management Information

The Mallala Community Wastewater Management System is a full sewer system.

This means septic tanks have been by-passed with all waste directed into the system.

The contents flows via gravity to one of four pump stations situated around the town, then pumped to the treatment plant on Wasleys Road.

Wastewater is treated through a number of processes and eventually used to irrigate the town oval.

Products

Most cleaning products available today are suitable if used in moderation.

Please avoid disposing of contaminants into the system;

- Large amounts of bleach
- Solid materials
- Sanitary items
- Nappy wipes
- Fats and oils
- Storm water

By avoiding the above pollutants into the system will help us provide good quality water at the oval.
